

AMOS SS24 - Project 6

Ailixir - AI agent generation framework

Project name	Ailixir - AI agent generation framework
Project mission	Ailixir is a proof of concept for an AI-agent generation framework which primarily allows administrators to deploy agents specialised in various knowledge domains, for instance: health, economics, biology etc. Each agent is delivered via a mobile app which enables end users to compare the results produced by different LLMs when they have access to specialised domain knowledge.
Industry partner	Andi Zink
Team logo	
Project summary	<p>The scrum team, composed of 6 software developers, 2 product owners and 1 scrum master, completed 121 backlog items (502 story points) within a timeline that spanned 11 weekly sprints.</p> <p>Ailixir's project goals achieved are:</p> <ul style="list-style-type: none">- Acquisition & storing of current knowledge from knowledge sources (websites, podcasts, videos, academic literature) utilising Python.- Receiving more accurate and relevant replies from the LLMs: Three different LLMs were integrated via LangChain. The acquired content was turned into custom domain context (embeddings in a vector store) utilising the Retrieval Augmented Generation (RAG) technique. The LLMs base their answers on this domain context and can provide links to the original sources.- Creation of a mobile app using React Native for interacting with the agents using text and voice.
